

How To Get Your Web Page On The Internet Using the FTP Program 'FileZilla.exe'

NOTE: The instructions listed below are for people who create their own webpage using html/css code. If you use a webpage design program you should use the instructions within that program for uploading your webpage to the "Host" server (homesite of your webpage).

1. Download the program 'FileZilla.exe' off the internet.
2. Contact <http://justhost.com> and open an account and get your domain name (website name), username, and password.
3. You can now upload all the web page files from your C: drive to the <http://justhost.com> server by using the file transfer protocol (FTP) program 'FileZilla'. You'll find that FileZilla is the best program to upload your web page files (html, gif, jpg, etc.) to any 'Host' server. Just run FileZilla.exe and enter the host, username, and password information in the three windows at the top of the screen (see below). Next, click the 'quickconnect' button positioned to the right of the three windows. This will connect you to the <http://justhost.com> servers. Once you connect, you'll see your C: drive directories listed in the window on the left side of the screen. The window on the right side of the screen will list all the directories currently on the <http://justhost.com> servers.
4. Find the 'public_html' directory listed on the HOST server and open it up (see example below).
5. Now, select (on your C: drive) all your web page files. Right click your mouse and select 'upload'. Just make sure you upload the files to the 'public_html' directory on the host server.

NOTE: The most important web page file in your C: drive web page directory is the '**index.html**' file. This file **MUST** be uploaded to the 'public_html' directory on the host server. The host server will NOT load your web page correctly if the 'index.html' (lower case only) file is missing. The index.html file is the 'file name' of your web page (all web pages **MUST** have the file name - index.html). The first file the host server program looks for (and executes) when someone tries to load your web page off the internet is the 'index.html' file. Just remember, after you finish creating your web page on your computer, save the file as 'index.html'.

FileZilla program windows are shown below:

Step 3.

HOST (your domain name).com	Username xxxxxxxx	Password xxxxxxxx	quickconnect
---------------------------------------	-----------------------------	-----------------------------	---------------------

Step 5.

C: drive

Your C: drive directories are listed in this window

Step 4.

Host server

This window will list the directories on the 'Host' server. Find the 'public_html' directory and click on it to open it up.
